Target version:		Spent time:	0.00 hour

The screenshot shows a web browser window at the URL "autainsight.pms.mishainfotech.com/blog/soccer". The page displays a PHP error message: "ErrorException compact(): Undefined variable \$uuid" occurring at "PHP 8.2.25" on "10.48.28". Below the error message, there is a section titled "Expand vendor frames" which lists "App \Http \Controllers \web \BlogController: 131" as the source of the error. To the right of this list, a code editor shows the relevant PHP code from "app / Http / Controllers / web / BlogController.php:131". The code includes comments and logic for fetching the next post and selecting archives based on status, domain_id, and type. The code is as follows:

```
// Fetch next post (newer)
$nextBlog = Post::where('id', '>', $blogDetail->id)
    ->where('status', 1)->where('domain_id', $this->domain_id) ->where('type', $this->dataType)
    ->orderBy('id', 'asc')
    ->first();

}

$sarchives = Post::select(
    DB::raw("MONTHNAME(created_at) as month"),
    DB::raw("YEAR(created_at) as year"),
    DB::raw("COUNT(*) as post_count")
)->where('status', 1) ->where('domain_id', $this->domain_id) ->where('type', $this->dataType) -
```
